

Refrigerant Grade CO2 (R744)

Refrigerant grade CO2 (R744), part of the extensive range of specialist gases offered by A-Gas, is available in gas or liquid form in 10 and 30 Litre cylinders.

- CO2 can be used as a refrigerant and is becoming increasingly popular due to its excellent properties and low global warming potential.
- CO2 can be used alongside other primary refrigerants such as Hydrocarbons and ammonia.
- Refrigeration systems that contain CO2 require strict controls on moisture, oil and other contaminants.
- At A-Gas we have invested in specialist cylinder valves with residual pressure devices to prevent contamination of the cylinder. This has resulted in a revision to our specification and enables us to provide a refrigerant grade CO2 that has a moisture content of less than 10 parts per million (Industrial grade CO2 does not meet this requirement).
